VACCINATION IS ESSENTIAL! VACCINATION PROTECT LIVES!

- Vaccination protects against COVID-19, the disease triggered by the CORONA virus.

- All authorised vaccines have a high medical effectiveness. Especially against severe courses of the disease.

- The vaccines are safe as they have been tested well. They are being checked further continually.

- There are different vaccines. The vaccines do not change the DNA – as sometimes asserted.

- For full protection you need two vaccination appointments. With the "Johnson & Johnson" vaccine only one dose is necessary.

- The most frequent side effects may be pain, skin reddening or swellings at the injection site, tiredness, headache or a temperature.

- Once many people have been vaccinated, a lot of restrictions of public life will fall. Before that, however, a large part of the population will have to be immune.

- If you have already had CORONA, you should wait another six months with your vaccination. Having overcome the disease means you are safe for the time being.

- Vaccination is completely voluntary and there is no check whether you get yourself vaccinated or not. Your legal residence status is not affected by vaccination.

- You may get your vaccination at the Borough Vaccination Centre or by your family doctor.

- With questions about the vaccination please contact your family doctor.

- Information about who is currently entitled to be vaccinated is provided on the website of the Borough and on Facebook.

- Even after vaccination: Still go on wearing a mask and obey the rules.

- Vaccination does not only protect yourself but also your family and friends!
